Product requires C
goal: x = v
keep: l ≤ h ≤ u

Module: primitives
A: adds to x, needs y = p_0
B: moves y; h = a·x + b·y

Planner: from the goal back to the start

1. A reaches the goal
2. A needs y = p_0, so B first
3. A alone moves h out of its bounds, so B moves along

4. **Planned skill**, checked and described
